Ringtail Possums *Pseudocheirus peregrines* are found all along the east coast, preferring areas of dense growth for concealment and ease of movement.

Breeding

Ringtails usually breed from April to November. Normally producing twins, the young are in pouch until about 7 weeks old, later riding around on Mum's back.

Notes

Young Ringtails are particularly susceptible to predation by dogs, cats, and foxes. When you place the nestbox in a tree, make sure there is an adjoining canopy of branches, or attach strong ropes to neighbouring trees, giving them 'aerial walkways', and not forcing your new residents to 'run the gauntlet' on the ground.

Unlike the more familiar and boisterous Brushtail Possum, these smaller possums do not try to take up residence in our roofs; preferring instead, tree hollows, and very well constructed temporary spherical nests (dreys). Occurring from rainforest to woodland, and common in most areas of the East coast, including suburban gardens, they move through the foliage at night in a rather 'deliberate' manner, in search of leaves, flowers, fruits, and buds.

1. Introduction

Natural tree hollows form when fungus and termites eat out the dead centre of old trees. Most Eucalypt species do not form these hollows until they are at least 100 years old. Although there are vast tracts of native plantation timber (particularly on the East Coast), they are typically harvested at around 60 - 80 years old. So of course hollows do not form.

Since European settlement, literally millions of trees (and hollows) have been lost to urbanisation, industry, roads, and agriculture. As if that isn't bad enough, our struggling native animals have to compete with introduced Honey Bees and Indian Mynas which aggressively colonise hollows.

These factors have led to some very desperate little marsupials trying to live in somewhat 'B grade' accommodation. Some examples are: Sugar Gliders trying to live in the fronds of Banana trees, Feathertail Gliders turning up in the electricity boxes on top of power poles, Microbats trying to sleep in mailboxes, and our seldom seen little Antechinus' trying to raise their babies in sock drawers, and even kitchen stoves. Far from ideal... Many of these animals of course turn up in care.

2. Benefits of Nestboxes

Although we cannot possibly hope to replace the countless natural hollows lost in the bush, our towns, cities, and farms were once forest. As a result, there is an awful lot of displaced wildlife competing for an ever decreasing amount of this prized real estate. This is where we can all really make a difference; in our suburban gardens, and rural properties.

A single well placed nestbox which survives say 10 years, can see a pair of Rosellas raise 10 generations of chicks. A slightly different box could provide a secure home to 6 adult Sugar Gliders. Different shape again could provide a luxury home to that 'trouble-some' Possum in your roof. Whilst yet another shape provides five star accommodation for up to 50 Microbats. When you consider that a single Microbat can consume one half it's own weight in insects each night, that's an awful lot less crawlies in your veggie patch and they provide this service completely free.

Nestboxes also provide priceless education for your children. Watching wildlife on TV is wonderful, but there is something very special about watching native animals coming and going, feeding, and raising their young so close to your home. If you've ever seen a Mountain Brushtail Possum looking out of her box at dusk, Pink nose resting on front paws - you'll know what I mean. Nestboxes are fun, easy and cheap to make, and once up will provide a secure home for many years to come.

Always locate the nest box in a safe area so that cats do not have access to it.

3. Construction

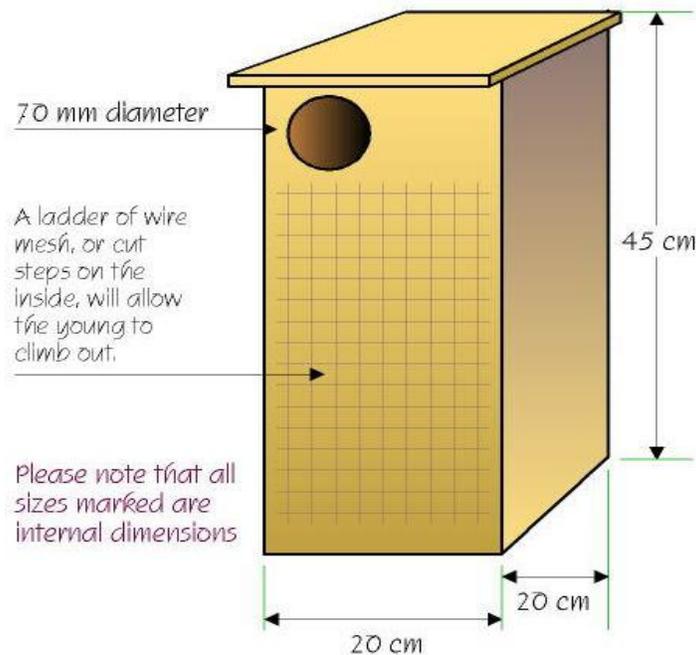

WILVOS prefer to release their ringtails in homemade dreys, which is the natural home for ringtail possums. Below is a plan for the construction of a nestbox suitable for them. Materials used, and notes are below the plan. Please note that all sizes marked are for internal dimensions.

The best materials for construction are either; 3 cm thick plantation pine (hardwood is a product of native forest), or structural pine plywood. There is of course no need to use expensive dressed timber. Rough sawn or even second hand timber is ideal. Just make sure if using second hand, that it is free of nails, and any unknown paint.

Ringtail dreys, which ringtails prefer.

Ringtail Possum Nestbox

Your box is best screwed rather than nailed together. The roof can either be hinged conventionally, or simply make an outside hinge out of a piece of old rubber, which also helps to make it weatherproof. A couple of offcuts on the inside of the roof to prevent slippage, and either mesh, or a few thin strips of offcut baton on the inside front to allow the youngsters to climb out.

VERY IMPORTANT: Drill a few 5mm drainage holes in the base. Young birds have quite literally drowned in non-drained boxes. And lastly: Throw plenty of dead leaves from native trees in the botto, almost up to the entry/exit hole.

Installation

So you're now the proud owner of a new Ringtail Possum nestbox. Where to place it?

Aspect: Choose your position carefully. Think about which side of your house takes the brunt of cold wind, and driving rain. (how comfortable would you be with an open wall on that side?) Face the entrance away from prevailing winds, and make sure that the box will have plenty of shade during the hottest part of the day. Hang from the chosen tree by a piece of wire threaded through a scrap piece of garden hose (so that it doesn't cut into the tree), or alternatively, nailed to the tree using 2 strips of galvanised steel. The strips need only go halfway round the tree to allow for growth, and to prevent ringbarking. Place at least 3 metres up the tree.

OK. So your new nestbox is in place, and you're sitting back with a 'cuppa; to move into their new home. Don't be disappointed or surprised if no one takes up residence immediately. It can sometimes take weeks, or even months, for someone to show some interest. There are many reasons for this:

The box is 'too new', unfamiliar. It looks and smells new and out of place. Give it time to 'weather in'. To become part of the local landscape.

Most birds for instance, nest in the Spring. Birds don't normally live in nests, only requiring them for breeding. If your box went up in May, it may not be required until say October. Mammals such as Possums do live in hollows all year round, but it's not until the parents actually kick the youngsters out of home, that junior will go in search of a new home.

While you're waiting for the box to be occupied, please resist the temptation to keep looking inside. You don't know who's checking the box out when you're not looking, and constant disturbance will only discourage them. You'll know when the locals move in by watching, listening, and by looking for droppings underneath.

Also, do not be alarmed if 'the wrong animal' moves into the nestbox. Hey, if an Eastern Rosella moves into the box you so carefully made for a Ringtail Possum... So be it. Obviously the Rosella's need was greater. Native animals will often move into the 'wrong sized' box.

1. Maintenance

Maintenance is necessary. Once a year, just have a quick look to see if any repairs need to be done, such as replacing any rotting timber, or making sure the box is still securely fastened to the tree. Also, watch that the growing tree doesn't pull apart the fastening.

Birds: Some introduced birds such as Sparrows, Starlings, and Mynas have become a menace; driving native birds away, or even building their own nests on top of existing eggs or young. Nest building by these species should be discouraged by removing nesting materials or eggs. If Indian Mynas are a continual problem, you may want to add a Myna baffle to the front of the box, or put a crabpot out to catch the Common Indian Mynas.

Bees: The introduced honeybee has also become a serious problem in some areas. They will readily colonise tree hollows (real or artificial). If you have a problem with bees, look up beekeepers in your Yellow Pages.

If you've taken the time to build and place a box like this, pat yourself on the back. YOU WILL have made a difference to YOUR local environment. Congratulations.
